DATE MAILED: 03/25/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/688,021

Applicant(s)

ANNAPRAGADA ET AL.

Examiner

Matthew A. Anderson

Art Unit

1765

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 25 February 2003.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1,4-7,10-18,20 and 21 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1,4-7,10-18,20 and 21 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 13 October 2000 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

**Priority under 35 U.S.C. §§ 119 and 120**

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)                      4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)                      5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) \_\_\_\_\_                      6) ☐ Other: \_\_\_\_\_

## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1,4-5, 7,10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hung (US 6,387,287 B1).

Hung et al. discloses in col. 16 lines 1-43 and in Table 10 a method of etching with plasma an organic silicate glass (i.e. the TEOS ARC layer) on a wafer with a gas comprising  $C_4F_8$  and  $CF_4$  and argon (Ar). In col. 17 lines 20-35, Hung further suggests the improvement of nitride corner selectivity by the inclusion of a more polymerizing gas such as  $CH_2F_2$ . The problems of reduced etch stop often associated with increased polymerization can be counteracted by the use of  $N_2$  or  $O_2$ . Hung et al. discloses an SiN etch using  $CH_2F_2$ ,  $O_2$  and Ar in Fig. 11. The need for gas chemistry control points one of ordinary skill to the inherent placement of a wafer in a reaction chamber for performance of this process.

Hung et al. does not explicitly disclose the use of  $CH_2F_4$  (aka tetra-fluoromethane) and  $O_2$  as components of the organic oxide etchant gas containing  $C_4F_8$ ,  $CF_4$ , and Ar.

Art Unit: 1765

It would have been obvious to one of ordinary skill in the art at the time of the present invention to modify the Hung et al. reference Hung et al. suggests the addition of CH<sub>2</sub>F<sub>2</sub> and O<sub>2</sub> to plasma etching gases for greater nitride selectivity and thus more precision in the manufacture of electronic devices

It would have been obvious to one of ordinary skill in the art at the time of the present invention to combine the usual C<sub>4</sub>F<sub>8</sub>, CF<sub>4</sub>, Ar, CH<sub>2</sub>F<sub>2</sub>, and O<sub>2</sub> in a plasma etchant gas used on organo-silicate glass (by its nature a dielectric) because such is suggested by the description of Hung et al. and such a combination of gases would have been expected to perform the function of organic glass etching with great selectivity to any underlying nitride etch stop layers.

3. Claims 6, 11-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hung et al. as applied to claims 1-5, 7-10 above, and further in view of Chiang et al. (US 5,739,579) and Wolf et al. (Volume 1, pp. 556).

Hung et al. is described above.

Hung does not explicitly suggest the etching through the underlying etchstop layer or of what material such a layer be composed.

Chiang et al. discloses a method for forming interconnections in devices of multiple levels. Chiang et al. discloses etch stop materials of Si<sub>3</sub>N<sub>4</sub> (silicon nitride and SiC (silicon carbide) and others in col. 14 lines 65+ and in col. 15 lines 1-3 beneath oxide layers of (see col. 13 lines 25-33) spin on glass (i.e. TEOS), PSG, and BPSG.

Art Unit: 1765

Wolf et al. discloses the patterning by etching of  $\text{Si}_3\text{N}_4$  layers with plasma etching of  $\text{CF}_4$  and  $\text{O}_2$  on page 556.

It would have been obvious to one of ordinary skill in the art at the time of the present invention to combine Hung with Chiang et al. and Wolf et al. because Chiang adds known materials for etch stop layers and Wolf et al. discloses how to pattern (i.e. etch them). Motivation for the combination is found in that Chiang et al. lists known materials which function as etch stops under organic silicates and Wolf et al. discloses the known use of specific gas chemistry to etch them. Chiang also add to the utility of etching the organic silicates since multilevel interconnections are suggested therein.

It would have been obvious to one of ordinary skill in the art at the time of the present invention to use a  $\text{Si}_3\text{N}_4$  etchstop layer and to etch it with  $\text{CH}_4$ ,  $\text{O}_2$ , and Ar because Chiang et al. discloses etch stop materials and Wolf et al. discloses means of etching  $\text{Si}_3\text{N}_4$ . The use of Argon as a diluent in etching gases was suggested by Hung et al. as above.

It would have been obvious to one of ordinary skill in the art at the time of the present invention to use a  $\text{Si}_3\text{N}_4$  etchstop layer and to etch it with  $\text{CH}_2\text{F}_2$ ,  $\text{O}_2$ , and Ar because Chiang et al. discloses alternate etch stop materials and Hung et al. discloses this means of etching  $\text{Si}_3\text{N}_4$ .

It would have been obvious to one of ordinary skill in the art at the time of the present invention to stop one gas flow ( $\text{C}_4\text{F}_8$ ) and ( $\text{CF}_4$ ) and switch to another gas flow ( $\text{CH}_2\text{F}_2$ ,  $\text{O}_2$  and Ar) because the  $\text{CH}_2\text{F}_2$ ,  $\text{O}_2$  and Ar mixture was specifically known in the art as a preferred etchant gas for  $\text{Si}_3\text{N}_4$ .

Art Unit: 1765

It would have been obvious to one of ordinary skill in the art at the time of the present invention to use a consistent gas formulation when again etching oxide because use of the same gas plasma formulation suggested above would have been expected to assure consistent results.

4. Claims 14, 20, 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hung et al. Chiang, and Wolf et al. as applied to claims 1-13 above in view of Li et al. (US 6,284,149 B1).

Hung combined is described above.

The combination does not suggest the stripping a photoresist with the specified etch chemistry.

Li et al. discloses a low dielectric oxide (divinyl siloxane-benocyclobutene). This material is described as a mostly polymer with a small amount of oxide included and is disclosed as an alternative to BPSG. A method of etching in Table 6 second step is shown to include O<sub>2</sub>, CH<sub>2</sub>F<sub>2</sub>, N<sub>2</sub>. The second step is described as for the removal of photoresist and excess low dielectric oxide. In column 19 lines 31-42 it is disclosed that the etchant gases can include Ar if the amount thereof is minimized.

It would have been obvious to one of ordinary skill in the art at the time of the present invention to combine Hung combined with Li et al. because Li adds known photoresist removal methods to the nitride selective organic oxide etching suggested above. Motivation for the combination is found in that Li et al. uses the same gases as

Art Unit: 1765

suggested in Hung combined thus reducing the need for other etchant gas chemistry and in turn reducing material costs.

It would have been obvious to one of ordinary skill in the art at the time of the present invention to stop one gas flow and switch to another gas flow because a mixture of  $\text{CH}_2\text{F}_2$ ,  $\text{O}_2$ , Ar, and  $\text{N}_2$  was specifically known in the art as a preferred etchant gas for photoresist and Hung combined above suggests another gas chemistry for organic oxides with nitride etch stop layers. The use of the optimal gas chemistry for the specific gas layer to be etched would have been obvious to the typical process engineer of ordinary skill. Such optimization would have been achieved with only routine experimentation.

### ***Response to Arguments***

5. Applicant's arguments filed 2/25/2003 have been fully considered but they are not persuasive.

6. In response to applicant's argument that Hung et al does not suggest organo-silicate glass to nitride selectivity, the fact that applicant has recognized another advantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985). Organo-silicate glass is an oxide and such selectivity would have been expected as suggested by Hung et al.

Art Unit: 1765

7. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., selective etching between nitride and organo-silicate glass) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

8. The argument against Li et al. is not persuasive. Li teaches a useful composition for stripping resist. The splitting of one step into two, where the processes are substantially identical in terms of function, manner, and result was held to not patentably distinguish the process. In this case, Li has a simultaneous etch/strip. Splitting this up would still have the same manner, function, and result which is etching and stripping.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Matthew A. Anderson whose telephone number is (703) 308-0086. The examiner can normally be reached on M-Th, 6:30-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Benjamin Utech can be reached on (703) 308-3836. The fax phone numbers for the organization where this application or proceeding is assigned are (703)

Art Unit: 1765

872-9310 for regular communications and (703) 872-9311 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0661.
